VERSION	DATE	CHANGES
1.0	05/09/2023	-

1. Purpose of the manual

“Eelectron Certificate Loader” by Eelectron SpA is a software created for the purpose of uploading and updating certificates (in pem format).

2. Installation requirements

To install and use the application, it is necessary WINDOWS® operating system (WINDOWS 7 or higher) and Microsoft® .NET Framework 4.6.1 or higher ; this one is already present if used on a PC with ETS5 or ETS6 installed.

3. Download application

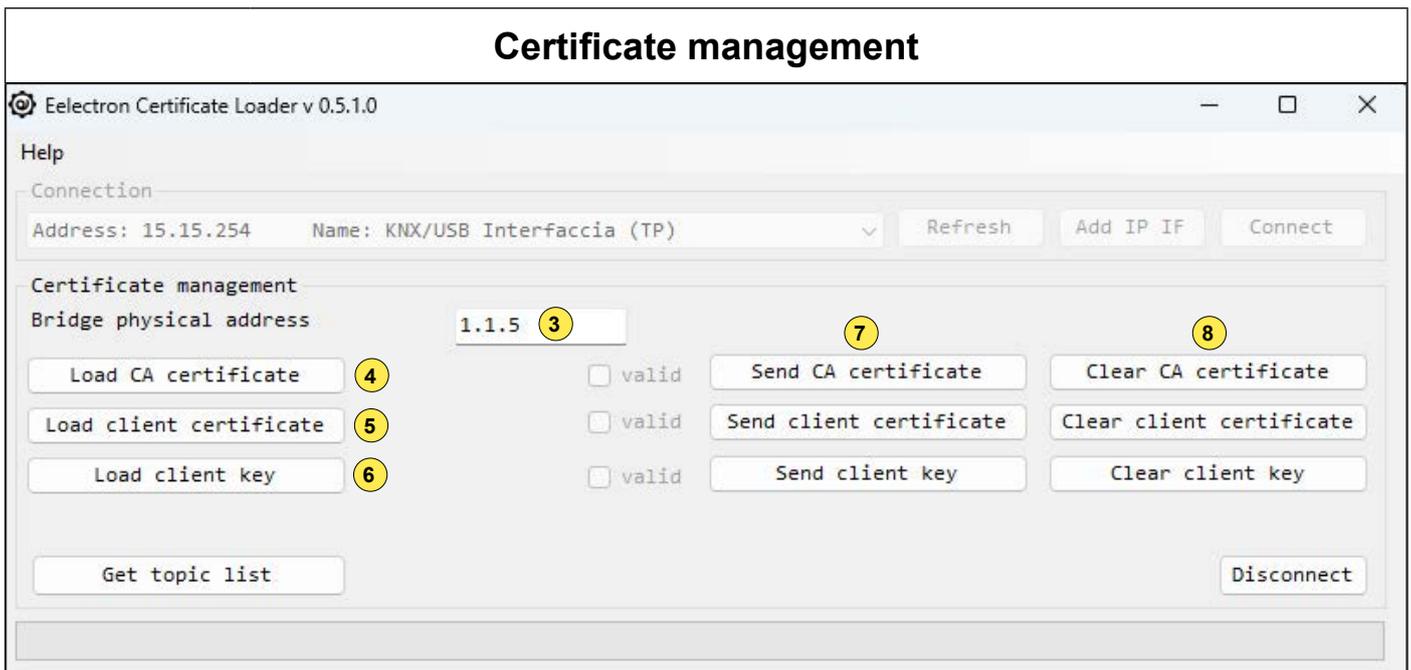

Download the application from site www.eelectron.com and save it on the PC. The application does not require installation, it is enough to extract the files in a PC directory.

4. Connect the device

- Power on the device, the bridge must be connected both to the bus KNX;
- Connect the PC to a KNX interface, then launch the application by clicking on the executable file eCertificateLoader.exe.
- Verify terms and conditions of the manufacturer before using the software by clicking on “Help - About”.
- Use the drop down list to select the KNX interface and click on ‘Connect’ to start the configuration.
- Click on “Refresh” to update the list of available connections.

1	As the first step, select from the dropdown menu the IP interface and click “connect” 2 it will available the section of certificate management described in the next screenshot.
----------	--

3	As the second step, insert the physical address of the device.
4,5,6	With this buttons is possible to load 3 types of certificates, in particular: <ul style="list-style-type: none"> • CA certificate: it guarantees the identity of the server (broker) • client certificate: it guarantees the identity of the client (the device) • client key: it guarantees the safe transmission of data
7	With this buttons it's possible to upload a certificate to the bridge.
8	With this buttons it's possible to clear the certificate uploaded to the bridge.

```

9

With this button it's possible to get the list of all the topics present on the device (bridge) and save it in csv format.

Each topic is identified by a code as, for example "1 p150" wich is composed by:

- 1 = is the index of the topic;
- p = it indicates the type of the topic: publish (p) or subscribe (s);
- 1 = QoS (Quality of Services) of the MQTT channel (0=0; 1=1, 2=2);
- 5 = it's the DPT size:
 - 1 bit = 0
 - 4 bit = :
 - 1 byte signed = 1
 - 1 byte unsigned = 2
 - 2 bytes signed = 3
 - 2 bytes unsigned = 4
 - 2 bytes float = 5
 - 3 bytes RGB = 9
 - 4 bytes signed = 6
 - 4 bytes unsigned = 7
 - 4 bytes float = 8

0 = it's the DPT type associated to the DPT size.

DPT type for 1 byte unsigned (0 = value 0-255, 1 = value 0-100%, 2 = angle, 3 = HVAC mode), in the other cases the value is 0.
